

PDM Group provides Europe's leading pet food manufacturers with a wide range of protein ingredients.

Pet food ingredients

PDM Group processes category 3 animal by-products from the meat and poultry industries to produce a range of chilled, frozen and dried pet food ingredients. The company is one of the largest suppliers of processed materials to the European pet food industry.

Raw materials are collected and processed under strict guidelines supervised by Government Veterinary Officers to ensure compliance with the EU Animal By-Products Regulations.

PDM Group operates two main pet food plants; Nottingham produces a range of dried poultry materials whilst Doncaster specialises in chilled and frozen products. Additionally, Doncaster is also the site for two joint venture operations producing specialist pet food ingredients; palatability enhancers and spray dried plasma.

PDM Group's Doncaster plant is the most advanced chilled and frozen pet food ingredient preparation facility in Europe. The new factory uses the very latest state-of-the-art technologies and automated control systems to produce quality ingredients for the European pet food industry.

The combination of continued investment in new technologies and development of new markets enables PDM Group to provide the meat industry with secure, sustainable added-value markets for by-products, and the pet food industry with a wide range of quality protein ingredients produced to the highest standards.

SERVING THE FOOD INDUSTRY THROUGH
CONTINUAL IMPROVEMENT

Frozen & chilled pet food - Doncaster

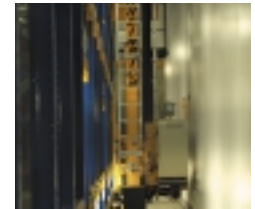

PDM Group's new Doncaster plant processes meat, poultry and fish products to produce a range of chilled and frozen pet food ingredients.

The plant employs the very latest state-of-the-art technologies and automated systems to control everything from raw material unloading and processing through to finished product storage.

In addition to providing operational and economic benefits to the pet food

and meat industries, the new plant has also substantially reduced PDM Group's environmental impact through the application of ozone-friendly refrigeration techniques.

The range of frozen and chilled products produced by the Doncaster plant are supplied to pet food producers in both the UK and overseas.

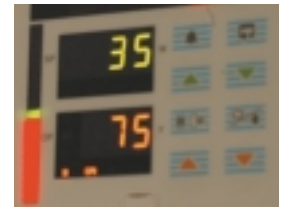

Dried pet food - Nottingham

PDM Group's Nottingham site produces quality dried poultry proteins and liquid fat supplements from a range of ingredients sourced from UK poultry companies. The protein and liquid fats are supplied to pet food producers across the UK and Europe.

Poultry products handled at Nottingham undergo a high temperature sterilisation process which creates a dry protein and separates the liquid fat.

The Nottingham plant has recently completed an extensive investment programme to introduce the latest automated raw material unloading and handling equipment. Material is handled in accordance with strict guidelines issued by the Regulatory authorities.
